

Reducing Infections and Disease in Dogs:

Successes, Challenges, and Opportunities

The ISCA Foundation is proud to offer a seminar given by Jason Stull, VMD, MPVM, PhD, DACVPM on Tuesday, May 26.

- ◆ Recognize behaviors and practices that increase dog vulnerability to infectious diseases
- ◆ Recall specific current challenges we face in reducing dog infectious disease spread
- ◆ Think toward future opportunities and needed adjustments to better protect dogs from infections

Infection diseases in dogs remain an important and dynamic challenge, posing risk not only to dog health but also to public health due to zoonotic pathogens (infections transmitted between dogs and people). As dogs become increasingly mobile and communal environments (e.g., dog parks, dog daycare, shows, sporting events) more common, proactive disease prevention strategies are more important than ever. The symposium highlights the successes we have achieved, ongoing challenges, and future opportunities in reducing infections disease risks in dogs.

Jason Stull, VMD, MPVM, PhD, DACVPM
